

PMMA Temporaries

With our PMMA Temporaries, you can provide your patients with a beautiful smile as soon as you prepare their teeth. These crowns and full-arch bridges restore lost vertical dimension and promote contoured healing for ovate pontics or anterior extractions. The temporary material is designed using CAD/CAM and forms a tooth shape that protects the prepared tooth, preventing damage to the periodontal tissues (gums) and disguises the prepared tooth to a degree until the final restoration can be made.

PMMA milled crowns are an adequate, fast, and reliable way to save chairside time and they offer these key characteristics:

- **100% biocompatibility**
- **High resistance to abrasion**
- **Reduce chairside preparation**
- **Prevents damage to the periodontal tissues**
